

Biogenix + TallyPrime

Integration feasibility, architecture, delivery plan and operational risks
Assessment date: 29 September 2026 | Repository: autoivd, ui-test branch

Feasible, with a staged accounting integration.

Biogenix can export finalized accounting records to TallyPrime. The recommended first release is one-way: Biogenix remains the operational source; TallyPrime receives validated accounting vouchers. Two-way stock or accounting sync should follow only after record ownership, valuation and conflict rules are agreed.

What the Tally API Explorer actually provides

The linked API Explorer is a testing tool for XML and JSON requests to a running TallyPrime instance. Its local connector supports browser-to-local testing; it is not a hosted Tally account endpoint. TallyPrime accepts XML-over-HTTP POST requests, usually on port 9000, while a company is loaded. TallyPrime 7.0 also has native JSON exchange; XML is the broader compatibility starting point. [1][2][3]

Biogenix codebase findings

The reviewed repository is a PHP 8.3/MySQL ERP with sales, procurement, stock, production, CRM and finance workflows. Finance records are generated from stock receipts and dispatches, with item, tax, payment and history tables. The project has existing background sync patterns but no Tally connector. This was a source-code assessment; no live database or Tally installation was available.

Biogenix source	Observed workflow	Proposed Tally record
Sales invoice	Dispatch creates a finance candidate; an operator generates the invoice with items and GST.	Sales voucher, only after generation.
Vendor bill	Goods receipt creates a candidate; an operator classifies and confirms bill values.	Purchase voucher after amount, tax and supplier reference are verified.
Payment	Incoming/outgoing payment is recorded and allocated to a finance document; reversal is supported.	Receipt or Payment voucher, with a reversal policy.
Delivery challan	Dispatch can generate a separate challan.	Delivery note only if required; avoid duplicate stock/accounting effects.
Masters	Customers, suppliers, products, units, companies and branches exist.	Map to party ledgers, stock items, UOMs, tax/bank ledgers and company.

Relevant code: admin/finance/finance_common.php (source creation and GST calculation),
admin/finance/finance_actions.php (generation, payment and reversal),
admin/migrations/2026_07_24_finance_module_pending.sql (finance schema), admin/sync/ (existing queue/retry patterns).

Recommended production architecture

Production integration flow

For a hosted Biogenix server and a local Tally installation, place the connector beside TallyPrime or on its private network. Let it fetch authenticated pending jobs from Biogenix, send XML to the local Tally HTTP service, then return parsed results. Do not expose the Tally HTTP port directly on the public internet. This deployment pattern is an architectural recommendation based on Tally's documented local HTTP endpoint. [2]

A voucher's lifecycle

Biogenix finalizes a document → a database transaction records an outbox job → a connector resolves company and master mappings → Tally imports a voucher → the connector parses CREATED, ALTERED, ERRORS and LINEERROR → Biogenix stores the Tally identity and status → a daily reconciliation compares both systems. [4]

What must be built

Component	Required behavior
Configuration and master mapping	Map each Biogenix company/branch to a named Tally company. Maintain approved maps for parties, ledgers, GST ledgers, bank accounts, stock items and units.
Accounting event rules	Export generated sales invoices and verified vendor bills; export posted payments. Define handling for no-document dispatches, cancellations, corrections and payment reversals.
Outbox and audit tables	Store source type/ID, source version, company, payload hash, Tally GUID/ID, attempts, response summary, status and timestamps. Use uniqueness per source/company.
Tally connector	Run on a Windows machine with Tally access. Create XML envelopes; set the target company explicitly; POST locally; parse XML errors and result counters.
Operations screen	Show pending, exported, failed and uncertain transactions; allow controlled retries and reconciliation; record who resolved a mismatch.
Test and rollout	Use a copied/test company, export representative vouchers, compare ledgers and GST reports, then enable company-by-company.

Suggested first-release scope

- Start with one company and generated sales invoices. Preserve Biogenix invoice number/date as a reference and choose an explicit Tally voucher numbering strategy.
- Add vendor bills after confirming supplier invoice number, bill date, taxable value and CGST/SGST/IGST detail.
- Add receipts and payments after deciding how corrections and reversals appear in both systems.
- Defer inventory and production postings until finance decides which system owns stock quantity and valuation.

Principal challenges and controls

Challenge	Practical control
Missing or mismatched masters	Preflight company, party, stock item, UOM and ledgers before sending vouchers. Tally lists these as voucher prerequisites. [4]
GST and rounding differences	Compare item taxable values, tax split and invoice grand total before import; test representative intra/inter-state cases.
Wrong company	Set SVCURRENTCOMPANY on every request and verify the mapped company is loaded. Tally notes that omitting it can use the active company. [3]
Duplicate imports after timeout	Use stable source identity, persist Tally GUID/ID, query or reconcile uncertain outcomes before retrying. Test overwrite configuration in the target company. [5]
Tally offline or import partially rejected	Queue and retry with limits; inspect XML response and Tally import logs; reconcile day books. [4]
Security and network access	Keep Tally HTTP inside a private network; authenticate the connector to Biogenix; restrict its company and action permissions.
Document ownership	Agree whether IRN/e-invoice originates in Biogenix or Tally so invoice numbers and GST filings remain consistent. [6]

Delivery sequence and decisions

Stage	Work and acceptance evidence
1. Discovery	Confirm TallyPrime version, installation location, license/test company, loaded companies, company GST registrations, voucher types and existing chart of accounts. Finance signs off the mapping table.
2. Proof of concept	Use the official API Explorer and a test company to import one party ledger, one sales invoice and one receipt; export each back and verify amounts, tax, reference and identity.
3. Biogenix connector	Add outbox, mapper, XML generator, local connector and parsed result storage. Test offline queueing, timeout uncertainty, duplicate prevention and wrong-company rejection.
4. Finance rollout	Pilot generated invoices for one company; compare day book, sales register and GST totals daily. Then add vendor bills, payments, reversals and more companies.

Indicative effort: a sales-invoice pilot may take about 2–4 weeks once a usable test Tally company and approved accounting mappings are available. Bills, payments, reversals and reconciliation add several weeks. Scope and effort depend heavily on Tally configuration and GST requirements; this is a planning estimate, not a quote.

Decisions needed before implementation

- Which TallyPrime release and deployment model are used: local Windows, network server, or TallyPrime Cloud Access?
- Which Biogenix company/branch maps to which Tally company and GST registration?
- Will Biogenix or Tally issue the legally final invoice and IRN, and which system owns voucher numbering?
- Do accountants want invoice-level detail and stock item postings, or accounting-only ledger vouchers in phase one?
- How should amendments, cancellations, returns, credit notes and payment reversals be represented?

Limits of this assessment

The assessment covers the cloned ui-test source and current official Tally documentation. It does not verify the production database, live Tally configuration, licenses, tax advice or a working end-to-end connection. The pilot should validate actual voucher behavior before deployment.
